Ques : How I will define the quality of a software ?

(Suppose I have ₹1000 in hand I went to buy cloths how I will define the quality)

Ans : Suppose I have ₹1000 and I go to buy clothes.

To define the quality of the clothes, I will check different things like:

- Whether the cloth material is good or not.
- If the stitching is proper.
- Whether the cloth is comfortable to wear.
- If the color fades after washing.
- Whether it fits properly.
- If it is worth the price I paid.

If the clothes satisfy my needs, last long, and work properly without defects, then I will say the quality is good.

Similarly, software quality means checking whether the software works correctly, is reliable, easy to use, secure, fast, and satisfies user requirements without defects.
